Descript - Senior Frontend Engineer, Marketing Web

April 30, 2026

Analog to what I've been doing for the past 2 years - and the main reason this role stood out to me.

At SalonCentric (a L'Oreal subsidiary), I built and ran A/B test variants using Optimizely - wrote the JavaScript and CSS for each experiment, handled cross-browser and cross-device QA, and iterated based on results. That work lifted conversion rates 20% in 2023 and user engagement 124% in 2024. When I read "maintain A/B testing infrastructure as a conversion driver for self-serve signups," that's what comes to mind.

Before that, 4 years at FullBeauty Brands building component-driven UIs on Salesforce Commerce Cloud across 5 brand storefronts - \$2.6M in monthly transactions, 939K page views per month. Part of that work involved learning WCAG accessibility standards and implementing them into the build process across all the brand sites, bringing them from level A to AA compliance.

I'll be straight about one gap: Next.js isn't on my resume. I have strong React fundamentals and I've been comfortable picking up new frameworks quickly throughout my career, but I haven't shipped anything with Next.js yet. For a role where it's core to the stack, I wanted to say that clearly rather than dance around it.

Descript's marketing site is the first thing a potential user interacts with. Getting the conversion loop right there is the whole game. That's the kind of work I want to be doing.

Thanks for reading,

Andrew Saganda
