Kickoff

AI Product Builder (Eng + PM)

Dear Kickoff team,

Fitness, nutrition, sleep, behavior change - these aren't things I'm willing to just work on, they're things I genuinely think about and care about. I track my workouts, I've gone through my own process of trying to build better habits around food and recovery, and I've seen firsthand how hard it is to actually change behavior. Kickoff's mission is exactly the kind of problem I want to spend my time on.

On the builder side: over the past year I've shipped 3 products from zero to one using AI coding tools as my primary build layer - TypescriptQuest (full-stack SaaS), Conntext (Chrome extension live on the Web Store), and CanIParkHere (React Native prototype with GPT-4.1 vision, validated from pain point to working app in a week). Each one I owned end-to-end: identified the problem, scoped the product, built it, and shipped it. That's the workflow your JD describes and it's how I actually work.

One honest gap: I haven't built a formal LLM evals framework yet. What I do understand is the core problem it solves, you can't improve what you can't measure, and eyeballing AI outputs at scale doesn't work. A coaching product where output quality directly affects whether someone hits their health goals is exactly the right place to build that capability, and I'm motivated to.

Sincerely,

Andrew Saganda
