Knotch

Product Builder

Dear Knotch team,

Over the last year I've been building products from zero to one using AI coding tools -- not as a side experiment, but as my primary mode of work. TypescriptQuest is a gamified TypeScript learning platform I took from idea to a live, production-ready application solo: I identified the gap, defined the scope, and built the full stack using Claude Code as the AI coding layer -- React, Node, PostgreSQL, Stripe, OAuth. I also built Conntext, a Chrome extension published on the Chrome Web Store, end-to-end using the same approach. And I rapidly prototyped CanIParkHere, a React Native app that uses GPT-4.1 vision to analyze parking signs and output eligibility in real time. These projects and their code can be found on my github account, which is linked above.

The Knotch Product Builder role describes this workflow almost exactly: construct working prototypes using AI coding platforms, synthesize customer feedback, write requirements, validate concepts before handing to engineering. I don't have a PM title in my background, but I've owned the full product cycle on my own products. That's a gap I'd fill by observing how Knotch's actual PMs work. My background in development makes it smoother for me to collaborate with engineers on the team to bring the prototype to production.

What appeals to me about Knotch specifically is that the role sits at the exact intersection where I already operate: deep enough technically to build, clear enough on product to decide what's worth building. I'd be excited to bring that to your content intelligence platform.

Sincerely,

Andrew Saganda
